

ONT3010 : 3rd Year Software Development Projects

CHECK LIST

Description	Checked (Y/N)
1. Provide input validation wherever possible. NOT just for User Login. (Consider using UI controls or specify validation when declaring attributes)	
2. Mandatory fields are indicated on all input forms. Preferably by means of asterisk (*).	
3. Standard date format used consistently throughout application. Preferably dd/mm/yyyy. User must not have to wonder what date format to use. System should force correct format or convert to correct format automatically. (Implement Date Validation / Date Picker etc.)	
4. All list boxes/combo boxes should list items alphabetically or in some logical order.	
5. Minimise on the amount of typing that a user needs to do; this also reduces errors. Allow users to select from list boxes, combo boxes, etc.	
6. Be careful of using dark fonts on dark backgrounds. Need to have a good contrast for readability.	
7. Buttons standard – placement, size, font, BACK, NEXT, CANCEL, etc.	
8. Do NOT use field names straight from database for labels and/or grid column headers.	
9. Form titles must be meaningful to user. For eg. do not show title <i>frmPlaceOrder</i> or <i>INDEX</i> , but rather <i>Place Customer Order</i> .	
10. Preferably have some kind of search filter for data grids (if used).	
11. Must provide dynamic search /report generator options, allowing user complete flexibility with regards the criteria upon which output / reports should be generated.	
12. Where applicable, allow users to select time period for reports. (Date ranges)	
13. Make sure all passwords are masked.	
14. Ensure that no passwords are stored in database as plain text. They need to be encrypted & decrypted.	
15. Disable buttons that should not be accessible at any step of the process.	
16. Ensure you have separate address lines (not all address details in one field).	
17. Allow ADD's in place where required. Things like SUBURB's CITY's and CONDITIONS can be added on the fly - ie. add them if they don't exist, else select if there.	
18. User should be able to select a city and relevant suburbs. Should NOT be required to enter these.	
19. MUST do "soft" delete and NOT "hard" delete. Confirm delete with user.	
20. Ensure all error messages help the user to diagnose, repair and recover from error. Provide meaningful error messages and not generic/default error messages.	
21. Internal consistency throughout application, i.e. same look and feel throughout your application.	
22. Make optimal use of the screen real estate, i.e. do not have lots of unused space on your forms.	

"My program should be written to make the users life easier not to make my life as a programmer easier".

As far as possible write code to avoid errors and thus negate the need for error trapping.
