Correct

Mark 1 out of 1

This code builds a DataFrame named shots from a dictionary in which allRows represents the data for the DataFrame and columnNames represents the column names:

- ☐ a. `shots = pd.DataFrame(data=allRows, headers=columnNames)`
- ☐ b. `shots.DataFrame(data=allRows, headers=columnNames)`
- ☒ c. `shots = pd.DataFrame(data=allRows, columns=columnNames)` ✓
- ☐ d. `shots.DataFrame(data=allRows, columns=columnNames)`

Question 2

Correct

Mark 1 out of 1

This code reads just the metadata of a Stata file named gss.dta into a metadata container named gss_meta, assuming that the pyreadstat module has already been imported:

- ☒ a. `gss_empty, gss_meta = pyreadstat.read_dta('gss.dta', metadataonly=True)` ✓
- ☐ b. `gss_empty, gss_meta = pyreadstat.read_stata('gss.dta')`
- ☐ c. `gss_meta = pyreadstat.read_dta('gss.dta', metadataonly=True)`
- ☐ d. `gss_meta = pyreadstat.read_stata('gss.dta', metadataonly=True)`

Question 3

Correct

Mark 1 out of 1

A Stata file consists of

- ☐ a. a metadata container and one or more data files
- ☒ b. a data file and a metadata container ✓
- ☐ c. a metadata container that contains a data file and a metadata file
- ☐ d. a data file and one or more metadata files

Question 4

Correct

Mark 1 out of 1

This code loads data from a JSON file named shots.json into a dictionary named shots:

- ☒ a.

```
with open('shots.json') as json_data:
    shots = json.load(json_data)
```
- ☐ b.

```
with open('shots.json') as json_data:
    shots = json.read(json_data)
```
- ☐ c.

```
with open('shots.json') as json_data:
    shots = pd.load_json(json_data)
```
- ☐ d.

```
with open('shots.json') as json_data:
    shots = pd.dict(json_data)
```

Question 5

Correct

Mark 1 out of 1

This statement reads three columns of the data in a Stata file named gss.dta into a DataFrame named gss:

- ☐ a.

```
gss.read_stata('gss.dta', columns=['year', 'wrkstat', 'hrs1'])
```
- ☒ b.

```
gss = pd.read_stata('gss.dta', columns=['year', 'wrkstat', 'hrs1'])
```
- ☐ c.

```
gss = pd.read_dta('gss.dta', columns=['year', 'wrkstat', 'hrs1'])
```
- ☐ d.

```
gss.read_dta('gss.dta', columns=['year', 'wrkstat', 'hrs1'])
```

Question 6

Correct

Mark 1 out of 1

To import the data from a database into a DataFrame, you

- ☐ a. import the entire database and then use Pandas methods to delete the rows and columns that you don't need
- ☒ b. use SQL to create a SQL statement that selects the data that you want from the database and then use that statement in the `read_sql_query()` method
- ☐ c. use Pandas methods to create a SQL statement that selects the data that you want and then use that statement in a `read_sql_query()` method
- ☐ d. import the entire database and then use the Pandas `sql_select()` method to keep just the rows and columns that you want to work with

Question 7

Correct

Mark 1 out of 1

To drill down into the data of a JSON file, you

- ☐ a. doubleclick on the filename in a cell of JupyterLab to open it in a new tab and click on the triangles in front of the data levels
- ☒ b. open the file in a new tab of JupyterLab and click on the triangles in front of the data levels ✓
- ☐ c. use a Python for loop
- ☐ d. open the file in a new tab of JupyterLab and doubleclick on the text for the data levels

Question 8

Correct

Mark 1 out of 1

This code extracts the files from a zip file named jobs.zip and saves the unzipped files on disk:

```
from zipfile import ZipFile
file_names = list()
with ZipFile('jobs.zip', mode='r') as zip:
    zip.extractall()
    for file in zip.infolist():
        file_names.append(file.filename)
        print(file.filename, file.compress_size, file.file_size)

=====
jobs/all_data_2018.xlsx 70296790 71834374
```

At that point, this statement will import the Excel file that was unzipped into a DataFrame named jobs.

- ☐ a. `jobs = pd.read_excel(file_names[1])`
- ☐ b. `jobs = pd.read_excel("all_data_2018.xlsx")`
- ☐ c. `jobs = pd.read_excel("jobs/all_data_2018")`
- ☒ d. `jobs = pd.read_excel(file_names[0])` ✓

Question 9

Correct

Mark 1 out of 1

This statement imports a CSV file named jobs into a DataFrame named jobs:

- ☐ a. `jobs.read_csv('jobs.csv')`
- ☐ b. `jobs.import_csv('jobs.csv')`
- ☒ c. `jobs=pd.read_csv('jobs.csv')` ✓
- ☐ d. `jobs=pd.import_csv('jobs.csv')`

Question 10

Incorrect

Mark 0 out of 1

To get the data from a large Stata file into a DataFrame, you usually

- ☐ a. read the metadata, build a DataFrame for the metadata, and then read selected columns of the data in the Stata file into a DataFrame
- ☐ b. read the metadata and then use the DataFrame() constructor to build a DataFrame for selected data in the Stata file
- ☒ c. read just the Stata data into a DataFrame and read the metadata only if you need it to help understand the Stata data ❌
- ☐ d. read both the metadata and the Stata data directly into DataFrames and use the metadata DataFrame to help understand the data in the data DataFrame

Question 11

Correct

Mark 1 out of 1

Assume that there's connection object in a variable named conn and a query in a variable named query. Then, this statement reads data into a DataFrame named fires from a SQL file:

- ☐ a. `fires = fires.read_sql_query(query, conn)`
- ☒ b. `fires = pd.read_sql_query(query, conn)` ✔️
- ☐ c. `fires.read_sql_query(query, conn)`
- ☐ d. `fires = pd.read_sql_query(query, conn).extractall()`

Question 12

Correct

Mark 1 out of 1

To import the data from an Excel file into a DataFrame named fires, you can use this statement

- ☒ a. `fires = pd.read_excel('fires.xlsx')` ✔️
- ☐ b. `fires = pd.import_excel('fires.xlsx')`
- ☐ c. `fires.read_excel('fires.xlsx')`
- ☐ d. `fires = read_excel('fires.xlsx')`

Question 13

Correct

Mark 1 out of 1

To get the data from a JSON file that has more than two levels of data into a DataFrame, you usually download the file to disk and use JupyterLab to drill down into it. Then, you

- ☐ a. use the `json.load()` method to load the file into a DataFrame
- ☐ b. use the `read_json()` method to read the file into a DataFrame
- ☐ c. use the `DataFrame()` constructor to build the DataFrame from the JSON file
- ☒ d. convert the JSON file to a dictionary, and use the `DataFrame()` constructor to build the DataFrame from the dictionary ✓

Question 14

Correct

Mark 1 out of 1

Assume that the URL for a CSV file is stored in a variable named `polls_url`. Then, this statement saves the file to disk in the same directory as the Notebook:

- ☐ a.

```
from urllib import request
request.urlretrieve(polls_url, filename='data/polls_2016.csv')
```
- ☒ b.

```
from urllib import request
request.urlretrieve(polls_url, filename='polls_2016.csv')
```

 ✓
- ☐ c.

```
from urllib import urlretrieve
request.urlretrieve(polls_url, filename='polls_2016.csv')
```
- ☐ d.

```
from urllib import urlretrieve
request.urlretrieve(polls_url, filename='data/polls_2016.csv')
```
